Lysis of Epidural Adhesions

**Description of Procedure or Service**

Lysis of epidural adhesions, also called the Racz procedure, involves passage of a catheter (Racz catheter) endoscopically or percutaneously under fluoroscopic guidance into the epidural space under general anesthetic or conscious sedation. Various protocols for breaking up adhesions, and reducing pain and inflammation have been described. The catheter may then be manipulated to mechanically break up adhesions and various agents, that may include anesthetics, corticosteroids, hyaluronidase, and hypertonic saline, are injected. In some protocols, the catheter is left in place and injections are repeated over several days.

Epidural fibrosis with or without adhesive arachnoiditis most commonly occurs as a complication of spinal surgery and may be included under the diagnosis of “failed back surgery syndrome.” Both result from manipulation of the supporting structures of the spine. Epidural fibrosis can occur in isolation, but adhesive arachnoiditis is rarely present without associated epidural fibrosis. Arachnoiditis is most frequently seen in patients who have undergone multiple surgical procedures.

Both conditions are related to inflammatory reactions that result in the entrapment of nerves within dense scar tissue, increasing the susceptibility of the nerve root to compression or tension. The condition most frequently involves the nerves within the lumbar spine and cauda equina. Signs and symptoms indicate the involvement of multiple nerve roots and include low back pain, radicular pain, tenderness, sphincter disturbances, limited trunk mobility, muscular spasm or contracture, and motor sensory and reflex changes. Typically, the pain is characterized as constant and burning. In some cases, the pain and disability are severe, leading to analgesic dependence and chronic invalidism.

Lysis of epidural adhesions, using fluoroscopic guidance, with epidural injections of hypertonic saline in conjunction with corticosteroids and analgesics, has been investigated as a treatment option. Theoretically, the use of hypertonic saline results in a mechanical disruption of the adhesions. It may also function to reduce edema within previously scarred and/or inflamed nerves. Finally, manipulating the catheter at the time of the injection may disrupt adhesions. Spinal endoscopy has been used to guide the lysis procedure, but the procedure is more commonly performed percutaneously using epidurography to guide catheter placement and identify nonfilling adhesions that indicate epidural scarring. Prior to the use of endoscopy, adhesions could be identified as nonfilling lesions on fluoroscopy. Using endoscopy guidance, a flexible fiberoptic catheter is inserted into the sacral hiatus, providing 3-D visualization to steer the catheter toward the adhesions, to more precisely place the injectate in the epidural space and onto the nerve root. Various protocols for lysis have been described; in some situations, the catheter may remain in place for several days for serial treatment sessions.
Lysis of Epidural Adhesions

Endoscopic epidurolysis is also being investigated for the treatment of degenerative chronic low back pain, including spondylolisthesis, stenosis, and hernia associated with radiculopathy. Along with mechanical adhesiolysis, hyaluronidase, ciprofloxacin and ozone have been applied.

***Note: This Medical Policy is complex and technical. For questions concerning the technical language and/or specific clinical indications for its use, please consult your physician.

Policy

Lysis of epidural adhesions is considered investigational for all applications. BCBSNC does not provide coverage for investigational services or procedures.

Benefits Application

This medical policy relates only to the services or supplies described herein. Please refer to the Member's Benefit Booklet for availability of benefits. Member's benefits may vary according to benefit design; therefore member benefit language should be reviewed before applying the terms of this medical policy.

When Lysis of Epidural Adhesions is covered

Not applicable.

When Lysis of Epidural Adhesions is not covered

Catheter-based techniques for lysis of epidural adhesions, with or without endoscopic guidance, are considered investigational. Techniques used either alone or in combination include mechanical disruption with a catheter and/or injection of hypertonic solutions with corticosteroids, analgesics, or hyaluronidase.

Policy Guidelines

The evidence for lysis in patients who have epidural adhesions includes randomized controlled trials (RCTs). Relevant outcomes are symptoms, functional outcomes, quality of life, medication use, and treatment-related morbidity. Several RCTs report benefits for epidural lysis of adhesions compared with placebo treatment. Many of these trials were conducted at the same center. The interpretation of these trials is limited by differences in patients, populations, and treatment protocol. The treatment for lysis of adhesions varies in the use of mechanical disruption, the type of lytic medications used, and the number of injections given. There is also a large effect seen in the placebo group, raising questions whether some component of the placebo treatment may be therapeutic. Larger trials with standardized treatment protocols would help determine whether specific treatment protocols have beneficial effects in specific patient populations. The evidence is insufficient to determine the effects of the technology on health outcomes.

American Pain Society

The American Pain Society’s (2009) clinical practice guidelines on interventional therapies, surgery, and interdisciplinary rehabilitation for low back pain did not discuss or draw conclusions on adhesiolysis. The guidelines stated that “for other interventions or specific clinical circumstances, the panel found insufficient evidence from randomized controlled trials to reliably judge benefits or harms.”

Billing/Coding/Physician Documentation Information
Lysis of Epidural Adhesions

This policy may apply to the following codes. Inclusion of a code in this section does not guarantee that it will be reimbursed. For further information on reimbursement guidelines, please see Administrative Policies on the Blue Cross Blue Shield of North Carolina web site at www.bcbsnc.com. They are listed in the Category Search on the Medical Policy search page.

Applicable service codes: 62263, 62264

BCBSNC may request medical records for determination of medical necessity. When medical records are requested, letters of support and/or explanation are often useful, but are not sufficient documentation unless all specific information needed to make a medical necessity determination is included.

Lysis of Epidural Adhesions

7/15/04 Specialty Matched Consultant Advisory Panel review 6/22/04. No changes to criteria. Removed statement under Description section, "It has been noted that these catheters have been sheared off in the epidural space of the spine. Additional procedures must be done to remove the sheared off pieces." Updated Benefits Application section and Billing section format for consistency. Added CPT code 0027T to Billing/Coding section. References added.

4/7/05 Policy Description revised. Added Policy Guidelines; "A search of current literature reveals few well-designed studies. Study flaws and absence of controlled trials make scientific conclusions impossible regarding efficacy. Larger multicenter studies are needed to confirm some of the finding of the small well designed trials with longer follow-up to determine long term outcomes.” References added.

6/22/10 Policy Number(s) removed (amw)

Lysis of Epidural Adhesions

12/21/10 Policy renamed from “RACZ Neurolysis” to “Lysis of Epidural Adhesions”. "Description” section revised. The “When Not Covered” section was reworded to indicate; “Catheter-based techniques for lysis of epidural adhesions, with or without endoscopic guidance, are considered investigational. Techniques used either alone or in combination include mechanical disruption with a catheter and/or injection of hypertonic solutions with corticosteroids, analgesics, or hyaluronidase.” No change to policy intent. Removed deleted CPT code 0027T from “Billing/Coding” section. “Policy Guidelines” updated. Specialty Matched Consultant Advisory Panel review 11/29/2010. References added. (btw)

5/24/11 Reference added. (btw)

4/17/12 Description section revised. Policy Guidelines updated. Medical Director review 3/29/12. Reference added. (btw)
