Panitumumab (Vectibix®)

Description of Procedure or Service

Panitumumab (Vectibix®, Amgen) is a monoclonal antibody that binds to the epidermal growth factor receptor (EGFR), preventing intrinsic ligand binding and activation of downstream signaling pathways vital for cancer cell proliferation, invasion, metastasis, and stimulation of neovascularization.

The RAS-RAF-MAP kinase pathway is activated in the EGFR cascade. RAS proteins are G proteins that cycle between active (RAS-GTP) and inactive (RAS-GDP) forms, in response to stimulation from a cell surface receptor such as EGFR, and act as a binary switch between the cell surface EGFR and downstream signaling pathways. The KRAS gene can harbor oncogenic variants that result in a constitutively activated protein, independent of EGFR ligand binding, rendering antibodies to the upstream EGFR ineffective. KRAS variants are found in approximately 30% to 50% of CRC tumors and are common in other tumor types. Another proto-oncogene that acts downstream from KRAS—NRAS harbors oncogenic variants in codons 12, 13, or 61 that result in constitutive activation of the EGFR mediated pathway. These variants are relatively rare compared with KRAS, detected in perhaps 2% to 7% of CRC specimens. It is unclear whether NRAS variants predict poor response to anti-EGFR monoclonal antibody therapy or are prognostic of poor CRC outcome in general. A third proto-oncogene, BRAF, encodes a protein kinase and is involved in intracellular signaling and cell growth and is a principal downstream effector of KRAS. BRAF variants occur in less than 10% to 15% of CRCs and appear to be a marker of poor prognosis. KRAS and BRAF variants are considered to be mutually exclusive.

Panitumumab (Vectibix) is an EGFR antagonist that was approved by the U.S. Food and Drug Administration (FDA) in September 2006. It is indicted for the treatment of wild-type RAS (defined as wild-type in both KRAS and NRAS as determined by an FDA-approved test for this use) metastatic colorectal cancer (mCRC) to be used in combination with FOLFOX as first-line treatment or as monotherapy following disease progression after prior treatment with fluoropyrimidine, oxaliplatin, and irinotecan-containing chemotherapy. Panitumumab is not indicated for the treatment of patients with RAS-mutant mCRC or for whom RAS mutation status is unknown.

Policy

BCBSNC will provide coverage for panitumumab (Vectibix) when it is determined to be medically necessary because the medical criteria and guidelines noted below are met.

Benefits Application

This medical policy relates only to the services or supplies described herein. Please refer to the Member's Benefit Booklet for availability of benefits. Member's benefits may vary according to benefit design; therefore member benefit language should be reviewed before applying the terms of this medical policy.

When Panitumumab (Vectibix) is covered

Panitumumab (Vectibix®), an EGFR antagonist, indicated for treatment of wild-type RAS (defined as wild-type in both KRAS and NRAS), is considered medically necessary for the treatment of patients with metastatic colorectal cancer:

- In combination with FOLFOX for first-line treatment, OR
- As monotherapy following disease progression after prior treatment with fluoropyrimidine, oxaliplatin, and irinotecan-containing chemotherapy, OR

Limitation of use: Vectibix is not indicated for the treatment of patient with RAS-mutant mCRC or for whom RAS variant status is unknown.

Use of panitumumab (Vectibix) may be considered medically necessary for clinical indications not listed above when the drug is prescribed for the treatment of cancer either:

- In accordance with FDA label (when clinical benefit has been established, (see Policy Guidelines); OR
- In accordance with specific strong endorsement or support by nationally recognized compendia, when such recommendation is based on strong/high levels of evidence, and/or uniform consensus of clinical appropriateness has been reached.

When Panitumumab (Vectibix) is not covered

Panitumumab (Vectibix) is considered investigational and therefore not covered when the above criteria are not met.

Panitumumab (Vectibix) is considered investigational when used for:

1. Non-cancer indications; OR
2. When criteria are not met regarding FDA labeling OR strong endorsement/support by nationally recognized compendia, as stated under “When Panitumumab (Vectibix) is covered.”
Panitumumab (Vectibix®)

Policy Guidelines

EGFR (epidermal growth factor receptor) is overexpressed in colorectal cancer. EGFR–targeted therapy with monoclonal antibody, panitumumab, has shown survival benefit in patients with metastatic colorectal cancer, however, this benefit is dependent upon lack of variants in certain genes in the signaling pathway downstream from EGFR.

Panitumumab (Vectibix) is administered by intravenous (IV) infusion. The recommended dose is 6 mg/kg every 14 days as an IV infusion over 60 minutes (≤ 1000 mg) or 90 minutes (> 1000 mg).

The infusion rate should be reduced by 50% for the duration of the infusion in patients experiencing a mild or moderate (grade 1 or 2) infusion reaction. The infusion should be terminated in patients experiencing severe infusion reactions, and depending on severity and/or persistence of the reaction, panitumumab may be permanently discontinued.

Drugs prescribed for treatment of cancer in accordance with FDA label may be considered medically necessary when clinical benefit has been established, and should not be determined to be investigational as defined in Corporate Medical Policy (CMP), “Investigational (Experimental) Services.”

Please refer to CMP “Investigational (Experimental) Services” for a summary of evidence standards from nationally recognized compendia.

Billing/Coding/Physician Documentation Information

This policy may apply to the following codes. Inclusion of a code in this section does not guarantee that it will be reimbursed. For further information on reimbursement guidelines, please see Administrative Policies on the Blue Cross Blue Shield of North Carolina web site at www.bcbsnc.com. They are listed in the Category Search on the Medical Policy search page.

Applicable codes: J9303, S0353, S0354

BCBSNC may request medical records for determination of medical necessity. When medical records are requested, letters of support and/or explanation are often useful, but are not sufficient documentation unless all specific information needed to make a medical necessity determination is included.

Scientific Background and Reference Sources

Panitumumab (Vectibix®)

Medical Director review 4/2019

Policy Implementation/Update Information

4/30/19 New policy developed. Vectibix is considered medically necessary for the treatment of patients with wild-type RAS (defined as wild-type in both KRAS and NRAS) metastatic colorectal cancer. Added HCPCS codes J9303, S0353, and S0354 to Billing/Coding section. References added. Medical Director review 4/2019. (krc)

Medical policy is not an authorization, certification, explanation of benefits or a contract. Benefits and eligibility are determined before medical guidelines and payment guidelines are applied. Benefits are determined by the group contract and subscriber certificate that is in effect at the time services are rendered. This document is solely provided for informational purposes only and is based on research of current medical literature and review of common medical practices in the treatment and diagnosis of disease. Medical practices and knowledge are constantly changing and BCBSNC reserves the right to review and revise its medical policies periodically.
